ACKNOWLEDGEMENT

First of all, we would like to express our deepest gratitude to God Almighty for His blessings and grace, which have enabled us to successfully complete our group project report entitled "The Development of the Classic Cafe Coffee Shop Website."

We would also like to express our sincere gratitude to our lecturer, Mr. Dimas Yudha Prawira, S.Kom, M.Kom, for his invaluable guidance, input, and support throughout the development of this project. His direction was fundamental in helping us understand the concepts of database design, backend implementation with PHP, and responsive frontend development using CSS and JavaScript.

Our thanks also go to all our group members, Zulfarida and Namira Assalwa, for their excellent cooperation, dedication, and contributions. Each member played a crucial role in the success of this project, from designing the database structure and developing backend and frontend functionalities to compiling the final report.

Lastly, we appreciate the various learning resources, such as the official documentation for PHP and MySQL, and other online platforms that helped us overcome design challenges during the project.

We hope that this report and the Classic Cafe Website project can contribute positively to our learning journey and serve as a useful reference for future web application development.

BACKGROUND

In the current era of rapid digitalization, a strong online presence has become a critical component for business success. This is especially true for the highly competitive Food and Beverage (F&B) industry, including coffee shops. While many businesses have embraced digital transformation, traditional establishments often face challenges in adapting to modern market demands.

Classic Cafe, as a business that offers a traditional and cozy atmosphere, faces the challenge of reaching a broader audience and streamlining its operational processes in a digitally-driven market. Without a dedicated digital platform, the cafe relies heavily on word-of-mouth and physical walk-ins, which limits its growth potential. Furthermore, manual processes for managing orders and customer inquiries can be inefficient and prone to errors, affecting the overall customer experience.

To address these challenges, the development of a dedicated website is proposed as a strategic solution. This website will serve as a digital storefront for Classic Cafe, providing an accessible and engaging platform for customers to view the menu, place orders, and communicate with the establishment. The project will be built using a robust stack of technologies: PHP for handling server-side logic and database interactions, and CSS and JavaScript to create a responsive and interactive user interface.

Therefore, this project aims to design and develop a functional and user-friendly website for Classic Cafe. The goal is to bridge the gap between its classic charm and the expectations of the modern consumer, ultimately enhancing its market presence, streamlining business operations, and improving customer satisfaction.

SYSTEM ANALYSIS

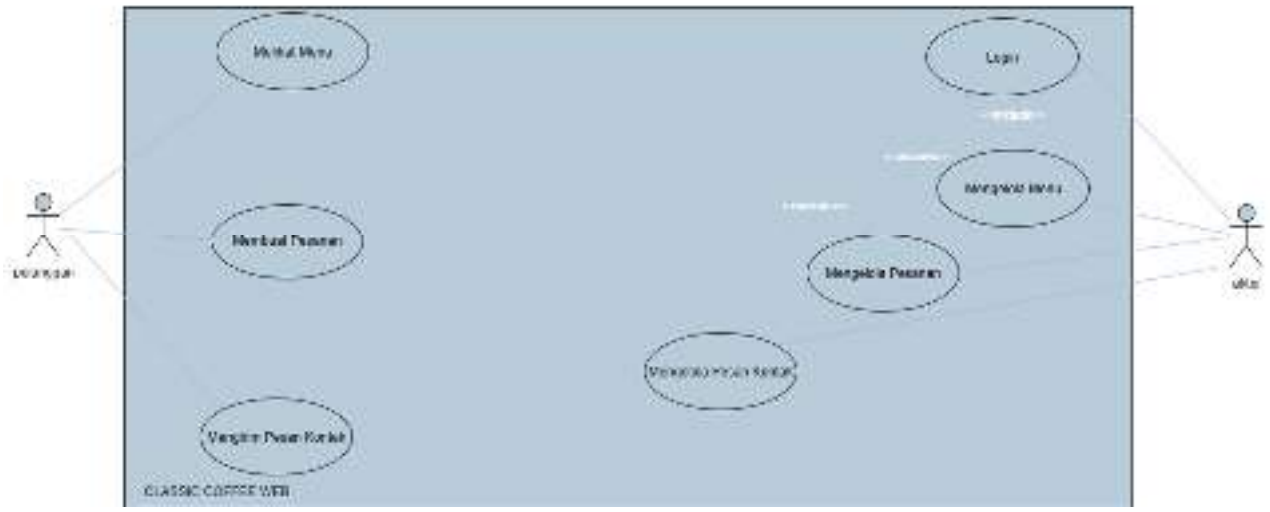

System Summary:

The "Classic Cafe" website is a web-based information and transaction system designed to be the primary digital platform for the coffee shop. The system is developed using PHP, MySQL, and a combination of HTML, CSS, and JavaScript.

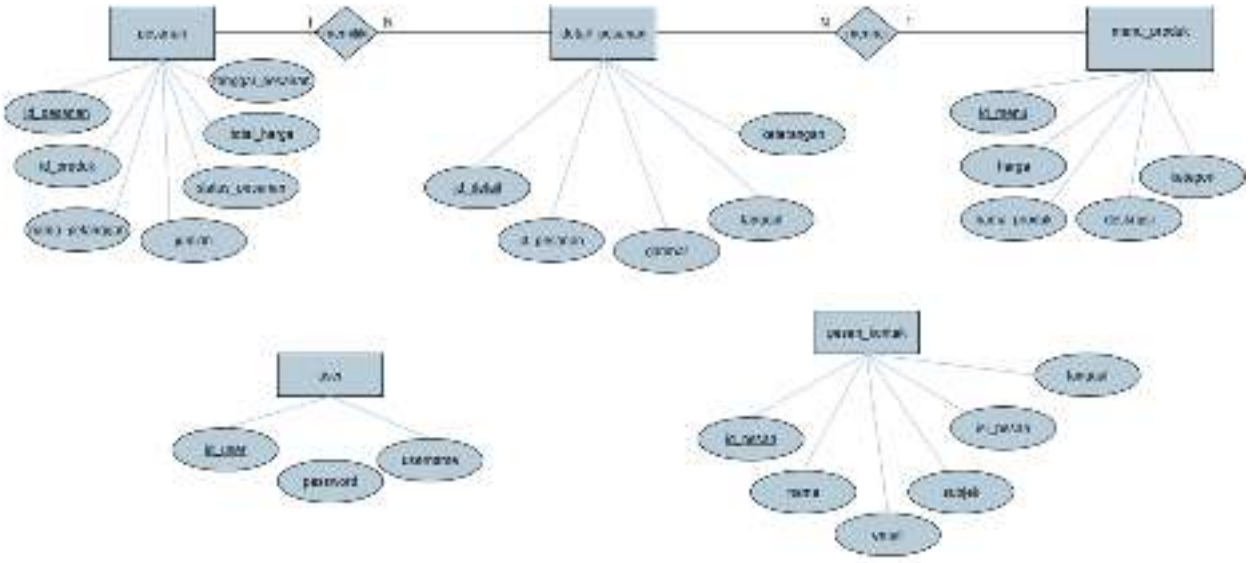

The main purpose of this system is to enhance the customer experience while streamlining administrative tasks. For the customer, it acts as a digital catalog providing easy access to the menu and as a transactional platform for placing orders. For the administrator, its main purpose is to provide a centralized management tool to efficiently update menu content, process incoming orders, and manage customer inquiries.

Functionally, the system is divided into a frontend (for customers) and a backend (admin dashboard). The core of the system's operations is its database structure with five key entities: User, Menu_Produk, Pesanan, Detail_Pesanan, and Pesan_Kontak, which are interconnected to effectively manage all data.
